PROFESSIONAL SUMMARY

Computer Science and Artificial Intelligence graduate (First Class Honours) and Backend AI Engineer Intern at FlyRank AI, with practical experience designing, debugging and validating multi-step LLM workflows using Make.com and Anthropic Claude. Foundation in Python, Scikit-learn and NLP for machine-learning model development and evaluation.

TECHNICAL SKILLS

AI & Machine Learning: Python, Scikit-learn, Machine Learning, NLP, Text Preprocessing, TF-IDF, Model Evaluation (Accuracy, Precision, Recall, F1-score)

LLMs & AI Automation: Anthropic Claude, LLM Workflow Design, Prompt Engineering, Structured JSON Outputs, Source-Grounded Generation, Human-in-the-Loop Review, Make.com

Data & Integrations: JSON Parsing, Regex, HTTP Requests, Jina Reader, Markdown-to-HTML Conversion, Google Sheets, Google Docs

Additional Programming & Databases: Java, SQL, Oracle Database

EXPERIENCE

Backend AI Engineer - Intern | FlyRank AI, Cairo, Egypt — Jul 2026 – Present

Tech Docs Research Workflow: multi-step LLM automation built in Make.com

- Designed and built a four-stage LLM research workflow in Make.com (Gather → Synthesize → Draft → Review & Format) that converts a question and 2–5 documentation URLs into a cited technical brief published to Google Docs.
- Applied prompt engineering to three Anthropic Claude calls with step-specific prompts, passing a structured JSON fact sheet between stages (each fact tied to a source ID and verbatim quote) to ground the brief in the supplied sources.
- Fetched documentation pages as clean text through HTTP requests to Jina Reader, with input validation (2–5 URLs, at least 2 usable sources) and error handling for failed URLs.
- Built an automated Claude review stage that checks every claim against the JSON fact sheet, removes unsupported statements and flags possible overclaims, followed by mandatory human-in-the-loop review in Google Sheets.
- Used Regex and JSON parsing to extract structured results from model output, converted Markdown to HTML for the Google Docs brief, and logged each step's status to a Google Sheets run log.
- Fixed two build bugs found during trial runs, then refined the Draft and Review prompts to address issues seen in trial output, such as uncited sources being listed and empty required sections being dropped.

PROJECTS

SpotFake — Fake News & Deepfake Detection — Sep 2025 – May 2026

Individual Final-Year Project, University of Hertfordshire

- Independently built, tested and presented the project end to end, with a React and TypeScript web interface.
- Applied text preprocessing, TF-IDF feature extraction and Logistic Regression for news-text classification.
- News-text classifier only (held-out 20% test split): 98.55% accuracy, 98.35% precision, 98.62% recall, 98.48% F1-score.
- Used Tesseract.js OCR to extract text from screenshots, so that text can be checked by the news-text classifier.
- Explored image-based features, including pixel, noise and frequency signals, to analyse potentially manipulated images.

EDUCATION

University of Hertfordshire (GAF), Cairo, Egypt — Sep 2023 – Jun 2026

BSc Computer Science and Artificial Intelligence — First Class Honours

Ilia State University — 2020 – 2022

Undergraduate study

LANGUAGES

Arabic: Native | English: Intermediate (B1)
